Rationale for Format and Content of School Library Media State Curriculum
Accepted by the Maryland State Board of Education - 26 October 2010

Given the current realities of the teaching/learning environment in schools and the need to develop college and career ready high school graduates, it is more important than ever that students be grounded in information literacy. This should be viewed as a responsibility shared by all members of the learning community; i.e., media specialists, content area teachers, support staff, administrators, parents and students.

The challenge in creating an information literacy curriculum is to create a document that does the following:

- Uses language that communicates to educators beyond just school library media specialists
- Uses the format of the content area curriculum documents
- Can be applied to instruction at all grade levels Pre K – 12
- Captures the process of information literacy
- Incorporates the previous content of Information Power, Maryland School Library Media Learning Outcomes, and the American Association of School Librarians Standards for the 21st Century Learner (see attached matrix)
- Incorporates use of technology as presented in the Maryland Technology Literacy Standards for Student

The language used in the curriculum document addresses the component processes associated with becoming information literate. General applications, rather than technology or content specific ones, have been identified in order to facilitate integration across content areas and grade levels. For clarity, and to facilitate assessment, each goal is comprised of a single facet of the overall process. While this gives the appearance of steps to be followed in a linear sequence, it should be viewed more as a cyclical process, with facets being revisited as many times as necessary to successfully master a given task.

Many of the content specific curriculum documents address discreet content to be covered at one specific grade level. In contrast the School Library Media Curriculum must address age appropriate applications of identical content for all grade levels Pre K – 12. The process of
interacting with information (locating, collecting, organizing, interpreting and sharing) remains constant whether students are in primary grades or high school. What does change is the level of expectation and the sophistication of resources used to produce final products. For this reason the curriculum is structured with shared Content standards, Topics and Indicators across grade levels and then paired with appropriate Objectives demonstrating increasing levels of expectation and independence as students progress through the grades.

The intent of the progression from PreK-12 is to move the students from guided instruction to independent information literacy. It is recognized that younger students need more guidance and that, as students mature, they are able to perform certain components of the information literacy process on their own. Since every student has different needs and a different learning path, the indicator in the curriculum of “with guidance” is a general guideline, and each library media specialist will provide the appropriate amount of guidance for each student.

*Information Power*, the *Maryland School Library Media Learning Outcomes* and the *AASL Standards for the 21st Century Learner* are largely parallel documents providing guidelines for teaching students to interact with information in efficient and effective ways. The responsibility of School Library Media Specialists is three fold: 1) to develop students’ appreciation of literature and reading; 2) to develop students’ ability to use information efficiently and effectively to understand and communicate ideas; and 3) to develop students’ ability to use technology as a tool for interacting with data, text and digital/sound files. The focus is on providing the necessary skills and strategies to design and implement assignments in the content areas that require students to interact with and use information in meaningful ways.

In the context of the School Library Media Curriculum, technology is viewed as a tool for interacting with information. References to specific programs, resources, formats or navigational skills are omitted in favor of more general statements related to developing the ability to evaluate, interpret, and generate information displayed in a variety of formats, both print and nonprint. There are obvious opportunities to integrate use of technology while locating, collecting, organizing, interpreting and sharing information. Listing specific examples of technologies will tend to limit rather than expand the potential integration of technology across the grades and content areas—the inference is that no list will contain all potential links. It is important that the School Library Media Curriculum communicates the role of technology as a tool for interacting with (locating, collecting, organizing, interpreting and sharing) information in order to understand and communicate ideas rather than technology being viewed as an end in and of itself. As fast as technology changes identification of specific technologies, hardware or software, will soon become dated.
